

How Can We Do This

Streaming video and broadcast television has historically had limited distribution. Only cable companies and satellite companies participated in providing consumers entertainment and programming. Now the internet offers a new distribution option, Internet Protocol Television or IPTV. But should it be limited to just the PC? Streaming video and broadcast TV should offer consumers and businesses access anywhere and anytime. Whether the media output device is a PC, the Television in the home, or the Cell Phone on the roam. Not just downloadable but instantly streaming to all of these platforms.

Our IPTV Platform delivers high quality video to your home or business using your existing high-speed Internet connection. Our Set Top Box connects the Internet to your TV, delivering high-quality content that you can watch on your TV, just like you would with normal TV. Instead of being stuck in front of a PC, you can enjoy high quality broadcasts and video on demand right from your favorite TV. Our system is an exciting new way to reduce the massive capital expenditure associated with building TV networks.
